### Problem 3:

An **invariant** is a property of a system that does not change over time. In the context of a program, an invariant is a property that holds true for all states of the program. Invariant can be used to verify the correctness of a program, to optimize the program, or to understand the behavior of the program.

Invariant can be used to verify the correctness of a program. For example, if we have a program that calculates the sum of a list of numbers, we can use the invariant that the sum of the list is equal to the sum of its elements to verify the correctness of the program.

Invariant can also be used to optimize the program. For example, if we have a program that calculates the sum of a list of numbers, we can use the invariant that the sum of the list is equal to the sum of its elements to optimize the program by only calculating the sum of the elements that have changed.

Invariant can also be used to understand the behavior of the program. For example, if we have a program that calculates the sum of a list of numbers, we can use the invariant that the sum of the list is equal to the sum of its elements to understand the behavior of the program.

**Problem 2**

The sequence alignment below is a multiple sequence alignment of a set of protein sequences. The sequences are aligned using the Needleman-Wunsch algorithm. The alignment is shown below with the sequence numbers in the first column and the sequence names in the second column.

### Abstract

[illegible][illegible]

**Problem 6**

Factorize

The Fibonacci method is an sequence of integer 1, 1, 2, 3, 5, 8, 13, ... that play an important role in nature and mathematics and the theory of the discrete system. They were used to design digital part of the in control systems. They are given by

$$F_n = \frac{1}{\sqrt{5}} \left( \frac{1+\sqrt{5}}{2} \right)^n - \frac{1}{\sqrt{5}} \left( \frac{1-\sqrt{5}}{2} \right)^n$$

Write a program that produces integer  $n$ th Fibonacci method like this or equal to zero value
